Step 3 Skin Cancer test	<ul style="list-style-type: none"> ➤ 1hour consultation and scan by qualified technicians. 	<ul style="list-style-type: none"> ➤ Outcomes report with recommendations

MoleMap is a state of the art program involving the digital imaging, archiving, and diagnosis of moles and other suspicious lesions.

The procedure utilises a combination of high resolution dermoscopy imaging technology that uses high intensity light to penetrate through the surface of the skin to show the structure of moles (and other lesions) and a dermatologist’s expert evaluation of the images.

In addition to the increased diagnostic accuracy associated with dermoscopy, MoleMap is able to detect at an earlier stage any new, changing and/or suspicious lesions by monitoring and comparing the images over time. While MoleMap has the ability to identify all skin cancers, its primary focus is on the early detection of melanoma.
